Transmission Expansion Advisory Committee Meeting

2010 Market Efficiency Analysis Final Input Assumptions

May 12, 2010
• Study years: 2010, 2013, 2016, 2019, 2024
• PROMOD IV model from Ventyx
• Underlying input data contained in PROMOD Powerbase (February 2009 update)
  – Updated fuel and emission costs as well as verified generating units based on November 2009 PROMOD Powerbase update.

• Powerflow Cases
  – 2010 power flow case to represent today’s “as-is” system
  – 2014 RTEP power flow case to represent future system
Key Input Parameters

- Fuel prices
- Load and energy
- Demand Response
- Future generation scenario
- Emissions prices
- Transmission topology
- Carrying charge rate and discount rate
Figure 1 - Fuel Price Assumptions

• generation model includes all existing in-service generation plus active queue generation with executed ISA minus expected future deactivations
• installed reserve requirement is met through study year 2013
• To meet installed reserve requirement for study years 2016, 2019 and 2024, 3,300 MW, 8,000 MW and 17,300 MW of new generation will be added to model, respectively
• New generation will be added to PJM regions in proportion to the regional location and regional generation type of future generation projects in Generation Interconnection Queues through Queue V
Figure 2 - PJM Market Efficiency Reserve Margin

- Forecasted Summer Peak Net Internal Demand
- Reserve Requirement
- Existing + Queue with Signed ISA - Retirement

MW vs Year

- 2010 to 2024
- 130,000 to 210,000 MW
- 3,300 MW and 8,000 MW
- 17,300 MW

Figure 3 - SO2 Emission Allowance Price Assumptions

$/Allowance vs Year

Year
Figure 4 - NOx Emission Allowance Price Assumptions

The graph shows the price of NOx emission allowances from 2010 to 2024. The price is given in $/Allowance. The black line represents the annual NOx price, which shows a general decreasing trend over the years. The green triangle line represents the seasonal NOx price, which shows a fluctuating pattern with some seasonal variation.
Figure 5 - CO2 Emission Assumptions
Transmission Topology and Constraints

- **Powerflow Cases**
  - 2010 power flow case to represent today’s “as-is” system
  - 2014 RTEP power flow case to represent future system

- **Thermal Constraints**
  - monitor/contingency pairs
  - NERC Book of Flowgates
  - Planning study results
  - Historical PJM congestion events

- **Voltage Constraints**
  - PJM reactive interface limits
  - MW limits based on historical values for “as-is” case adjusted for future upgrade impacts in 2014 case
• Discount rate and levelized carrying charge rate developed using information contained in TO Formula Rate sheets posted on PJM web site

• Discount rate based on weighted average after-tax embedded cost of capital (average weighted by TO total capitalization)

  Discount rate = 7.7%

• Levelized annual carrying charge rate based on weighted average net plant carrying charge (average weighted by TO total capitalization) levelized over an assumed 45 year life of project

  Levelized Annual Carrying Charge Rate = 19.1%
Next Steps

- PJM Board approval of input assumptions in June
- Begin analysis with regular updates to TEAC
