Regional Planning Needs and Solutions

Brent Oberlin
Director, Transmission Planning

ISO New England
Purpose:

This presentation provides an update on ISO New England’s (ISO-NE) regional system planning evaluations of the New England system

- Access to Planning Advisory Committee (PAC) materials containing Critical Energy Infrastructure Information (CEII) is required to access some of the ISO’s materials on transmission planning. Those stakeholders with CEII access do not require any further action. If you do not have access to ISO-NE’s PAC CEII information, please complete the CEII Request Process found at: https://www.iso-ne.com/participate/support/request-ceii-access

- Download and complete the CEII Access Request Form and then submit the completed Form into Ask ISO at: https://askiso.force.com/s/

- **Note:** If you have Reliability Committee (RC) CEII access, you still need to apply for PAC CEII access

- Should you have further questions, kindly contact Participant Support and Solutions by email: AskISO@iso-ne.com or by phone: (413) 540-4220 or (833) 248-4220

- The ISO-NE planning process was previously discussed with the IPSAC and a summary appears in Appendix B for stakeholder reference

- The information provided in this presentation is as of May 1, 2023
Three Ongoing Tariff Efforts

• Three separate efforts involving changes to the ISO’s Tariff are underway
  – Storage as a Transmission-Only Asset
    • The ISO held stakeholder discussions regarding proposed Tariff changes to allow storage to be considered as a transmission asset for the purposes of implementing solutions to Needs Assessments, Market Efficiency Transmission Upgrades, or Public Policy Transmission Studies
    • FERC filing was made on December 29, 2022; awaiting FERC decision
Three Ongoing Tariff Efforts, cont.

– Economic Study Process Improvements
  • The ISO has been discussing proposed Tariff changes to the Economic Study process to reflect stakeholder feedback from previous work and improve the process for future studies
  • The ISO submitted its filing to FERC on January 27, 2023, FERC approved the filing on March 30, 2023 and went into effect on March 31, 2023

– Extended-Term Transmission Planning*, Phase 2
  • The second phase of the effort will address the rules to enable a state or states to consider potential options for addressing the identified issues and cost allocation for associated transmission improvements
  • The ISO expects to begin discussions with stakeholders in the second half of 2023

*In some documents, this may be referred to as “Longer-Term Transmission Planning”
Interregional Study Request

• On **March 27, 2023**, ISO-NE sent a request for an interregional study to IPSAC

• Today, New England must respect a 1,200 MW loss of source limit to ensure reliability in both PJM and NYISO’s areas

• This 1,200 MW limit has the potential to constrain system design in New England, especially in the context of offshore wind resources

• ISO-NE requested:
  – Evaluation of the loss of source limit in today’s system to see if the limit can be raised above 1,200
  – If the limit on today’s system remains below 2,000 MW, identification of upgrades necessary to support a 2,000 MW loss of source limit

• JIPC is currently reviewing the request
The ISO finalized the scope for the 2050 Transmission Study on December 22, 2021.

Study objective: Given the future load and resource scenarios described in the “New England States’ Vision for a Clean, Affordable, and Reliable 21st Century Regional Electric Grid,” determine the following for the years 2035, 2040 and 2050:

- Transmission needs in order to serve load while satisfying NERC, NPCC, and ISO-NE reliability criteria
- Transmission upgrade “roadmaps” to satisfy those needs considering both constructability and cost

The study is restricted to thermal steady-state analysis:
- DC contingency analysis will be used to identify thermal constraints and develop transmission upgrades
- This analysis is expected to identify potential major transmission line additions
2050 Transmission Study, cont.

• The ISO discussed the preliminary N-1 and N-1-1 thermal results at the March 16, 2022 PAC meeting
  – Some of the key takeaways:
    • The Winter Peak in 2050 is the most challenging snapshot
    • The overloads are driven primarily by high heating load
    • Heavy North-South transfers may require additional transmission between generation-rich Northern New England and generation-deficient Southern New England

• The results of additional sensitivity analysis were discussed at the April 28, 2022 PAC meeting
  – Sensitivities on 2050 Winter Peak to establish the relationship between load level and overloads
  – Analysis to determine if summer-only overloads can be solved via different solar resource distributions
2050 Transmission Study, cont.

• At the July 20, 2022 PAC meeting, the ISO discussed:
  – Results reflecting modeling corrections
    • The updated results showed a relatively small decrease in the number of
      overloaded facilities, but there remain a significant number of system
      concerns
  – Approximate duration of overloads in response to stakeholder
    requests
    • Approximately 13 hours of exposure to loads above 51 GW, which is the
      load level selected to develop the base set of system upgrades
    • Results show that “capping” system load at lower load levels than those
      contemplated in the study can lead to a significant reduction in the miles
      of transmission overloads
2050 Transmission Study, cont.

- The ISO provided a further update at the December 13, 2022 PAC meeting:
  - Discussed the following lessons learned
    - Increasing the capacity of existing lines is effective
    - 345/115 kV transformers are critical
    - Generator sizes and locations can affect overloads
    - Solutions are sensitive to load duration
  - Discussed preliminary solutions for Southwest CT and Boston
  - Summarized the approach to solution development
The most recent discussion was at the April 20, 2023 PAC meeting:

- Presented possible solutions for:
  - Vermont
  - North-South transfer
  - Boston Import
- Developed an approach for dealing with cost estimates
- Summarized the approach to solution development
- Proposed approach for identifying “high-likelihood” concerns, which are those that occur under a wide range of studied conditions
Transmission Planning Technical Guide Update

• ISO-NE issued an update to the Transmission Planning Technical Guide (TPTG), dated March 24, 2023
  – Included updates to:
    • Appendix J – Load Modeling Guide
    • Appendix K – Distributed Energy Resource Modeling Guide
  – Included updates from the November 15, 2022 PAC meeting on the following topics
    • Maximum real power ratings
    • New methodology for establishing base case resource outages and transfers
    • Alignment of assumptions for pumped storage hydroelectric resources with the existing assumptions for Battery Energy Storage Systems
    • Voltage criteria
    • Load distribution at minimum load
    • Distributed energy resource modeling
Updating Area Study Plans*

• Vermont
  – 2032** Needs Assessment scope of work presentation was discussed with the PAC on December 13, 2022
    • Considers new methodology for dispatch creation
    • Includes additional peak and minimum load scenarios to capture renewable resource and storage assumptions
    • Includes steady state, stability, and short circuit analysis
  – Based on stakeholder feedback, the ISO has added a winter evening peak condition to the scope
    • Discussed at the February 15, 2023 PAC meeting
  – ISO-NE is working to issue a draft written scope for stakeholder review in the near future

*Links to each of the Key Study Areas can be found in Appendix A
**Since the December discussion, the study year is being changed to 2033
Updating Area Study Plans, cont.*

• Boston
  – 2032** Needs Assessment scope of work presentation was discussed with the PAC on December 13, 2022
    • Considers new methodology for dispatch creation
    • Includes additional peak and minimum load scenarios to capture renewable resource and storage assumptions
    • Includes steady state, stability, and short circuit analysis
  – The need for a winter evening peak condition was reviewed and found to be less severe than the summer peak conditions already considered
  – ISO-NE is working to issue a draft written scope for stakeholder review in the near future

*Links to each of the Key Study Areas can be found in Appendix A
**Since the December discussion, the study year is being changed to 2033
To achieve a better understanding of the effect of industry trends on our economic planning analyses, the ISO is proposing a Economic Planning for the Clean Energy Transition (EPCET) ‘pilot’ study, similar to our TPCET pilot study for transmission planning.

The EPCET pilot study plans to achieve three main objectives:
- Perform a dry-run of the study framework proposed in the upcoming Tariff changes
- Take a deep dive into all input assumptions in economic planning analyses, propose updates to any assumptions based on our current experience, and test the effect of those modeling changes
- Gain experience in the features and capabilities of our new economic planning software

The scope will include a set of four reference scenarios and then model stakeholder sensitivity requests:
- **Benchmark Scenario**: Model previous year (2021) to test fidelity of models against historical performance
- **Market Efficiency Needs Scenario**: Model future year (i.e., 10-year planning horizon) based on our existing planning criteria (CELT forecasts [EE, PV, EV, HP], FCM new/retired resources, state contracted resources, etc.)
- **Stakeholder-Requested Scenario**: Model a 2040 scenario to examine resource revenue sufficiency as part of the Future Grid Reliability Study Phase 2
- **Policy Scenario**: Model future year (i.e., year of last policy target, 2050) based on full effect of all New England state climate policies (i.e., electric sector and economy-wide de-carbonization)

The ISO initiated the study in April 2022 and expects to finish the work by Dec 2023 prior to the start of the new Economic Study cycle.
Market Efficiency Transmission Upgrades

• There have been no changes since the December 2022 IPSAC meeting
Public Policy Based Transmission

- Public Policy Transmission Upgrades (PPTUs) are upgrades designed primarily to meet local (e.g., municipal and county), state, and federal Public Policy Requirements identified as driving transmission needs relating to the New England Transmission System.
- The Public Policy process was initiated on **January 13, 2023**.
- The ISO discussed the process with the PAC on **January 19, 2023**.
- Two submittals were made:
  - Combined document containing both submittals.
  - Combined templates for both submittals.
- New England States Committee on Electricity (NESCOE) has the option to provide a communication regarding those submittals by May 1, 2020:
  - On April 28, NESCOE provided their **Submission Regarding Transmission Needs Driven by State and Federal Public Policy Requirements**.
  - No Public Policy Requirements were identified.
- Stakeholders have until May 16, 2023, to request that ISO-NE reconsider NESCOE’s position regarding federal public policy requirements.
- ISO-NE expects to present its position at the June 15, 2023 PAC meeting.
Regional System Plan Project List and Asset Condition List Update

• March 2023
  – Updates to the Regional System Plan (RSP) Project List
    • Three cost increases greater than $5M
      – $12.1M increase for the Wakefield 345 kV substation, cable and terminal work and Forest Ave Substation modifications
      – $13.4M increase for the Amherst 345 kV synchronous condenser project
      – $46.1M increase for the N12/M13 separation and reconductoring, Bell Rock Substation modification, and Kent County T3 345/115 kV transformer
    • One new project
      – Install a new protection system on the D-4 line via the A1/B2 lines
    • Three projects were placed in service – all are in Eastern CT
    • No projects were canceled
  – Updates to the Asset Condition List
    • 21 new projects added
    • 23 projects placed in service
  – Final RSP Project List and Asset Condition List update
    • Final PAC presentation
    • Final RSP Project List
    • Final Asset Condition List

New England’s System Planning Process
Continuous, Adaptive and Successful

– Open and transparent 10-year planning horizon reflects:
  • Update inputs/assumptions
  • Evaluate system needs
  • Market responses
  • Timing of future resource needs
– Provide information to marketplace and stakeholders
– Coordinate with neighboring areas

Update inputs/assumptions
Evaluate system needs
Opportunity for Market Responses

Wholesale Power Markets Resources committed annually
Develop regulated transmission solutions
Reliability Planning Process

• Needs Assessments evaluate the adequacy of the transmission system over a 10-year planning horizon
  – Incorporate resources (generation and demand response) that have a firm commitment to perform, typically receiving an obligation through the Forward Capacity Market
  – Incorporate energy efficiency and photovoltaic forecasts

• ISO New England utilizes a continuous planning process
  – No fixed schedule
  – Allows for the incorporation of assumption changes “on-the-fly” rather than waiting for the next cycle
  – Ensures that solutions are not under or over-built

• Solutions Development
  – Identification of needs to be addressed through the Solutions Study process or the Open Competitive Process (as per Attachment K)
    • If the requirements of Attachment K Section 4.1(j), including a year of need 3 years or less from the completion of the needs assessment, have been met then the Solutions Study process is used for solution development
    • If the year of need is greater than 3 years from the completion of the Needs Assessment, the competitive process is used for solution development
Public Policy Process

- At least every 3 years, the ISO issues a Public Notice indicating input on state and federal Public Policy Requirements (PPR) can be submitted to the New England States Committee on Electricity (NESCOE) and local (e.g. municipal and county) PPRs can be submitted to the ISO.

- NESCOE may provide a communication to the ISO regarding Public Policy Requirements.

- Specification of the federal, state and local PPRs, if any, that will be addressed in a Public Policy Transmission Study (PPTS). Federal and state PPRs will be specified by NESCOE and, if required, by ISO. Local PPRs will be specified by ISO.

- ISO performance of an initial phase of the PPTS and, if determined by ISO, a follow-on phase of the PPTS with opportunity for PAC to comment.

- If a Public Policy Transmission Upgrade will be pursued, the solution will be developed through the Open Competitive Process.
