

2022 Preliminary PJM Load Forecast

Load Analysis Subcommittee
December 6, 2021

Andrew Gledhill
Sr. Analyst
Resource Adequacy Planning

- Estimation Period: January 2012 through August 2021
- Weather Simulation: 1994 to 2020 (351 scenarios)
- Sector Models (1998-2020 Annual Data from EIA 861)
 - End Use Data: Based on Itron's 2021 release
 - Economics: September 2021 vintage from Moody's Analytics
- IHS Solar/Battery Forecast (zonal & peak allocation by PJM)
 - Production estimates by AWS
- PEVs
 - State targets and EIA 2021 AEO sales for non-target states
- Forecast Adjustments – APS, ATSI, COMED, Dominion

- History has been influenced by COVID-19. This impacts:
 - Sector results
 - Non-weather sensitive load results

- Variable introduced to the model “The Back-to-Normal Index”
 - <https://www.cnn.com/business/us-economic-recovery-coronavirus>
 - Allows model to calibrate to COVID-19 historical impacts that are not captured by sector or non-weather sensitive load

Back-to-Normal Index
Source: Moody's Analytics

- Values are set to 100 in February 2020 and earlier and November 2021 and later
- Zone values are produced using a weighted combination of state values

Sectors, Use Indexes, and Non-Weather Sensitive Load

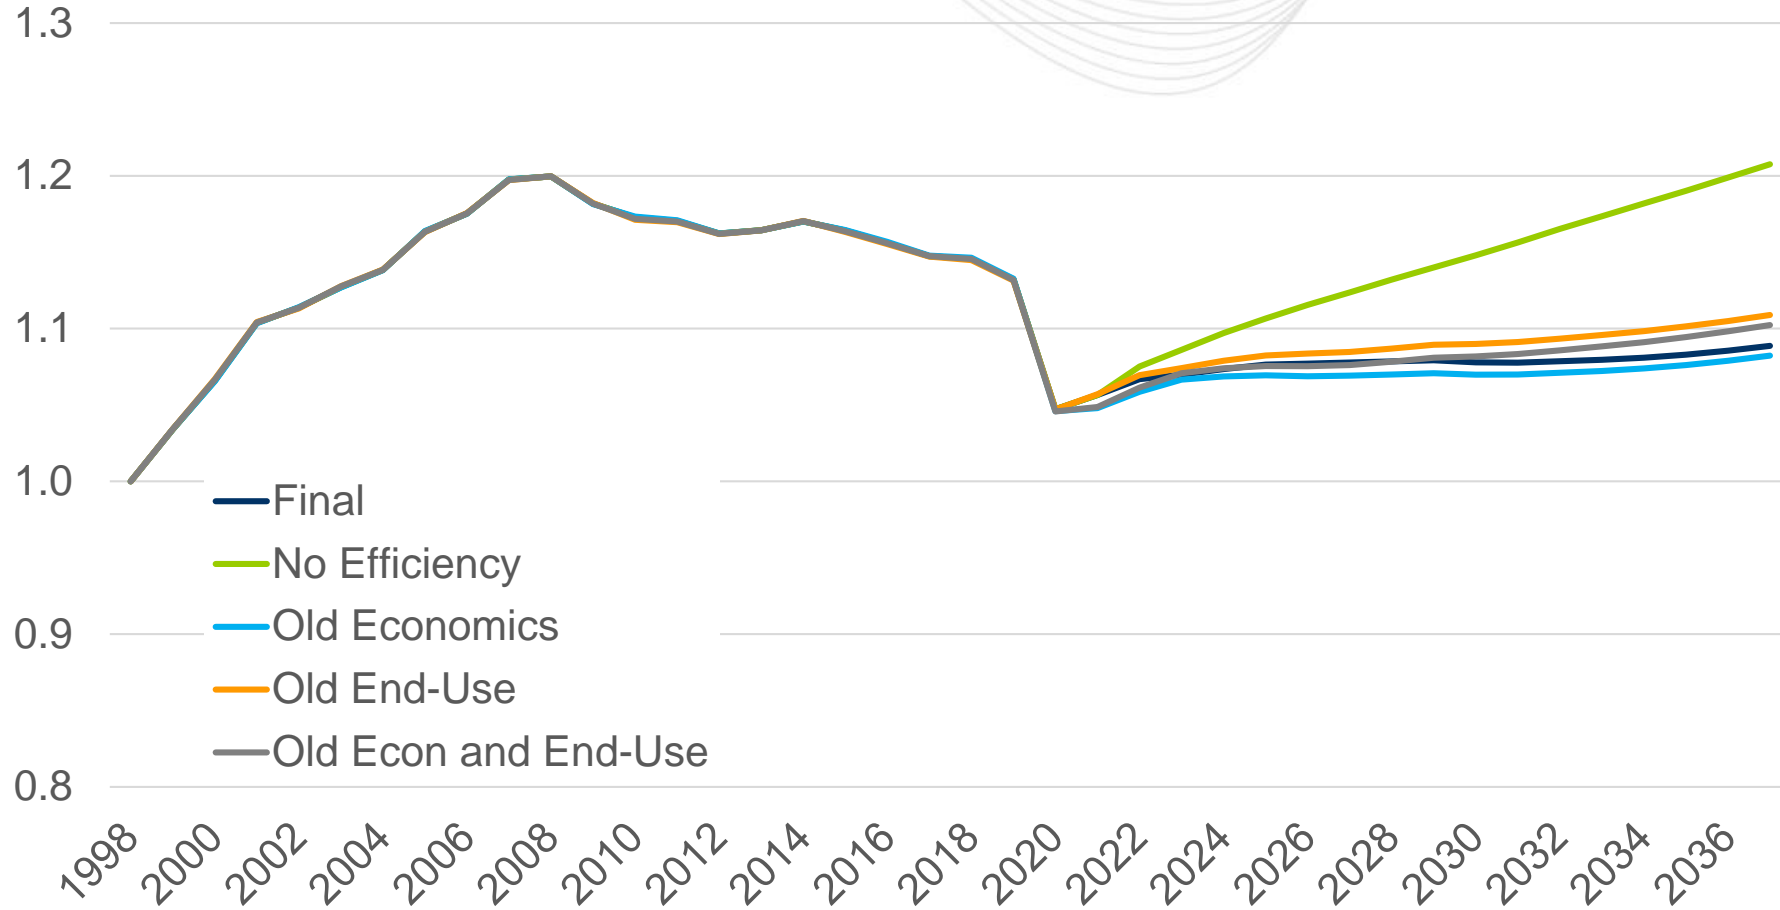

- Sector model results are influenced by two factors
 - Economics
 - Residential – Households, Personal Income, Population per household
 - Commercial – Employment, Population, Output
 - Industrial - Output
 - End-use (saturation/efficiency/intensity)
 - Residential
 - Commercial
 - Industrial

Residential Total Use
1998 = 1.0

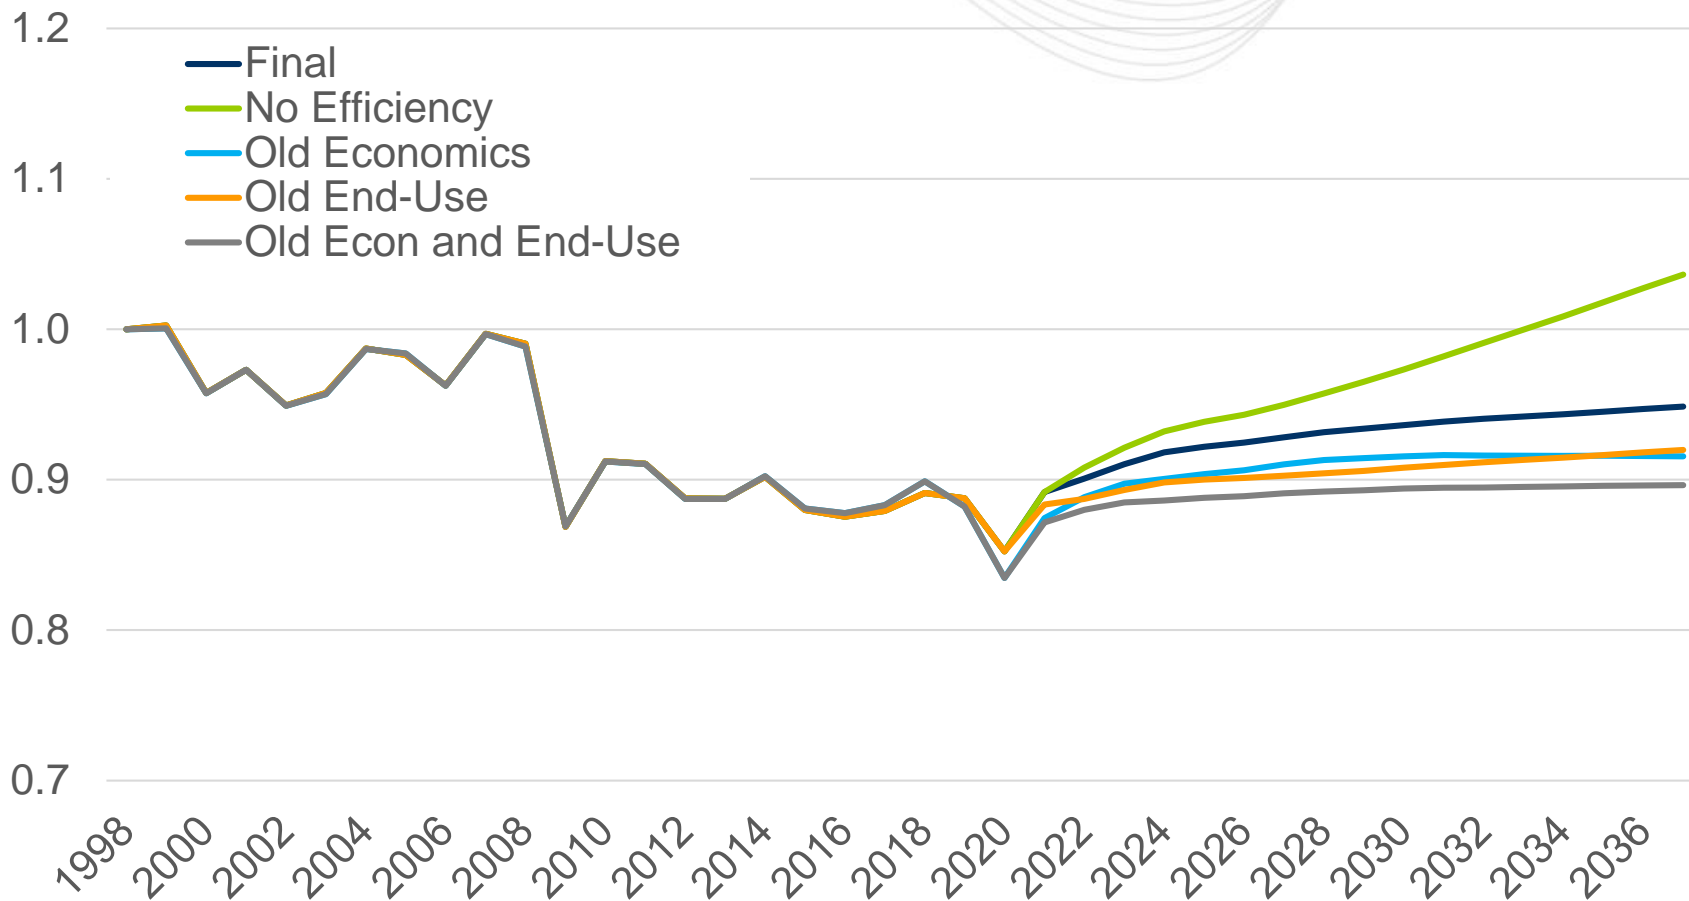

- Efficiency gains take away half of anticipated growth.
- Economic trend is not substantively different.
- New end-use forecast has slightly more efficiency than the past forecast.

Commercial Total Use
1998 = 1.0

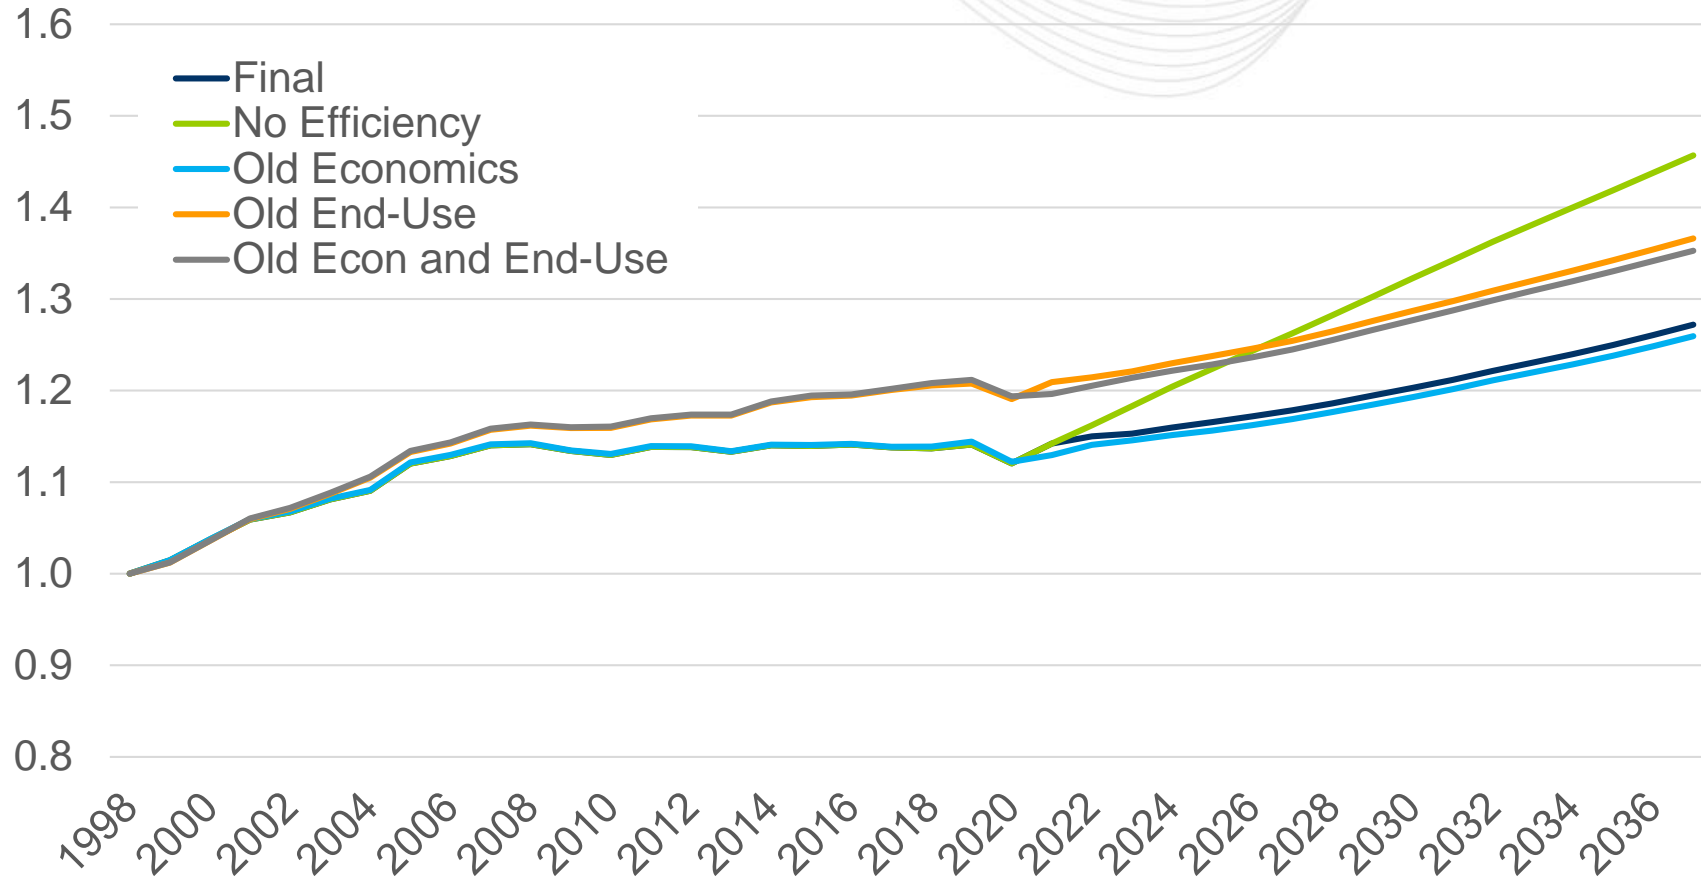

- Efficiency gains take away most of anticipated growth
- Economics are stronger than the past forecast.
- New end-use forecast has slightly more efficiency than the past forecast.

Industrial Total Use
1998 = 1.0

- Efficiency gains take away a little more than half of anticipated growth
- Economics are stronger than the past forecast.
- New end-use forecast has slightly less efficiency than the past forecast.

Cool Index
1998 = 1.0

- Efficiency gains take away more than half of anticipated growth.
- Economic trend is not substantively different.
- New end-use forecast has slightly more efficiency than the past forecast.

- Efficiency gains take away all of the growth. No push towards electrification.
- Economic trend is not substantively different.
- New end-use forecast has slightly less efficiency than the past forecast.

Other Index
1998 = 1.0

- Efficiency gains take away two-thirds of the growth.
- Economic growth is modestly stronger.
- New end-use forecast has similar efficiency to past forecast.

Non-Weather Sensitive Load July

- Efficiency gains take away more than half of the growth.
- Economic growth is modestly stronger.
- New end-use forecast has slightly more efficiency to past forecast.

Plug-in Electric Vehicles

| | |
|----------------------|---|
| District of Columbia | 25% of registrations by 2035 |
| Illinois | 1 Million EVs by 2030 |
| Maryland | 300k EVs by 2025 |
| New Jersey | 2 million EVs by 2035; 85% of sales in 2040 |
| Virginia | 8% of sales in 2024; 22% in 2025 |

- In states with targets, the target drives the forecast
- States without targets are pushed forward based on EIA 2021 AEO
 - Assumption of 4% of vehicle sales being EVs by 2030 and 8% by 2040

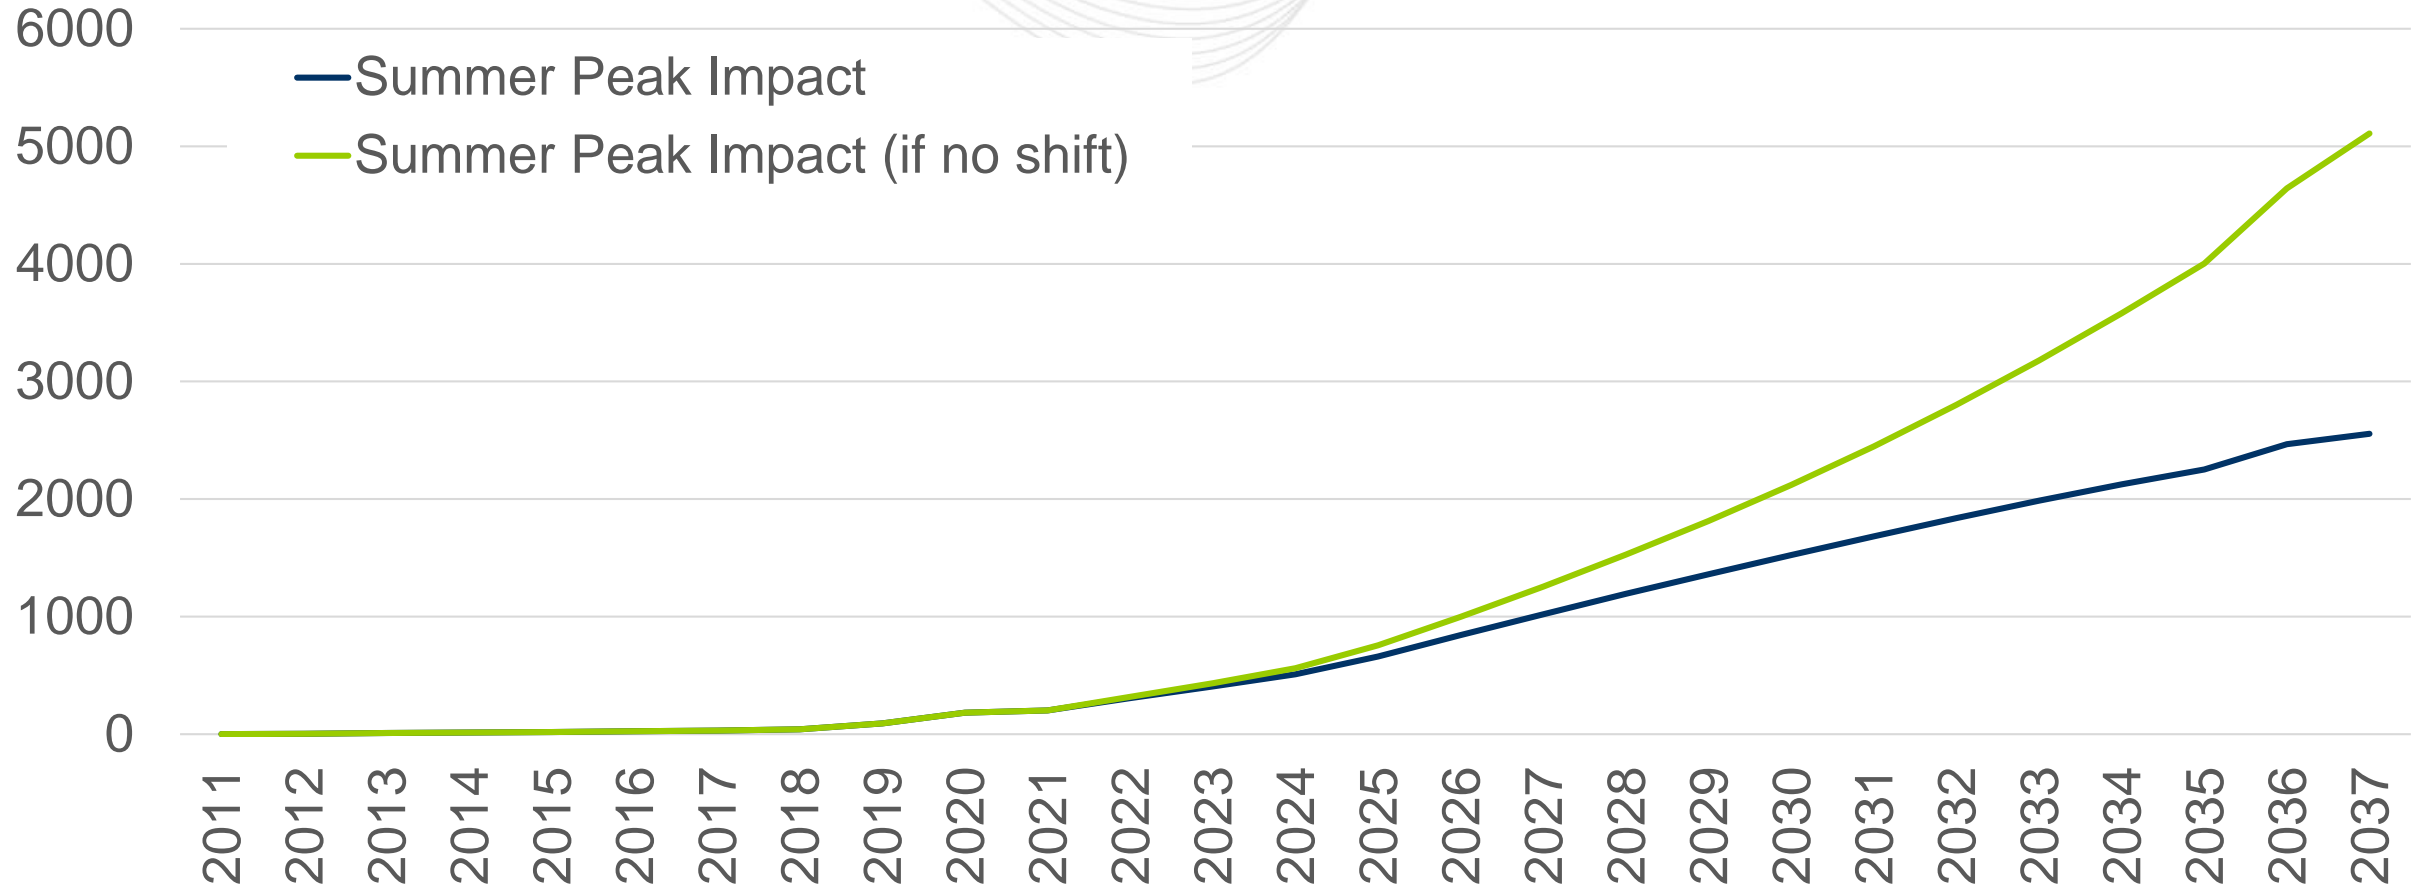

PJM Total Number of EVs

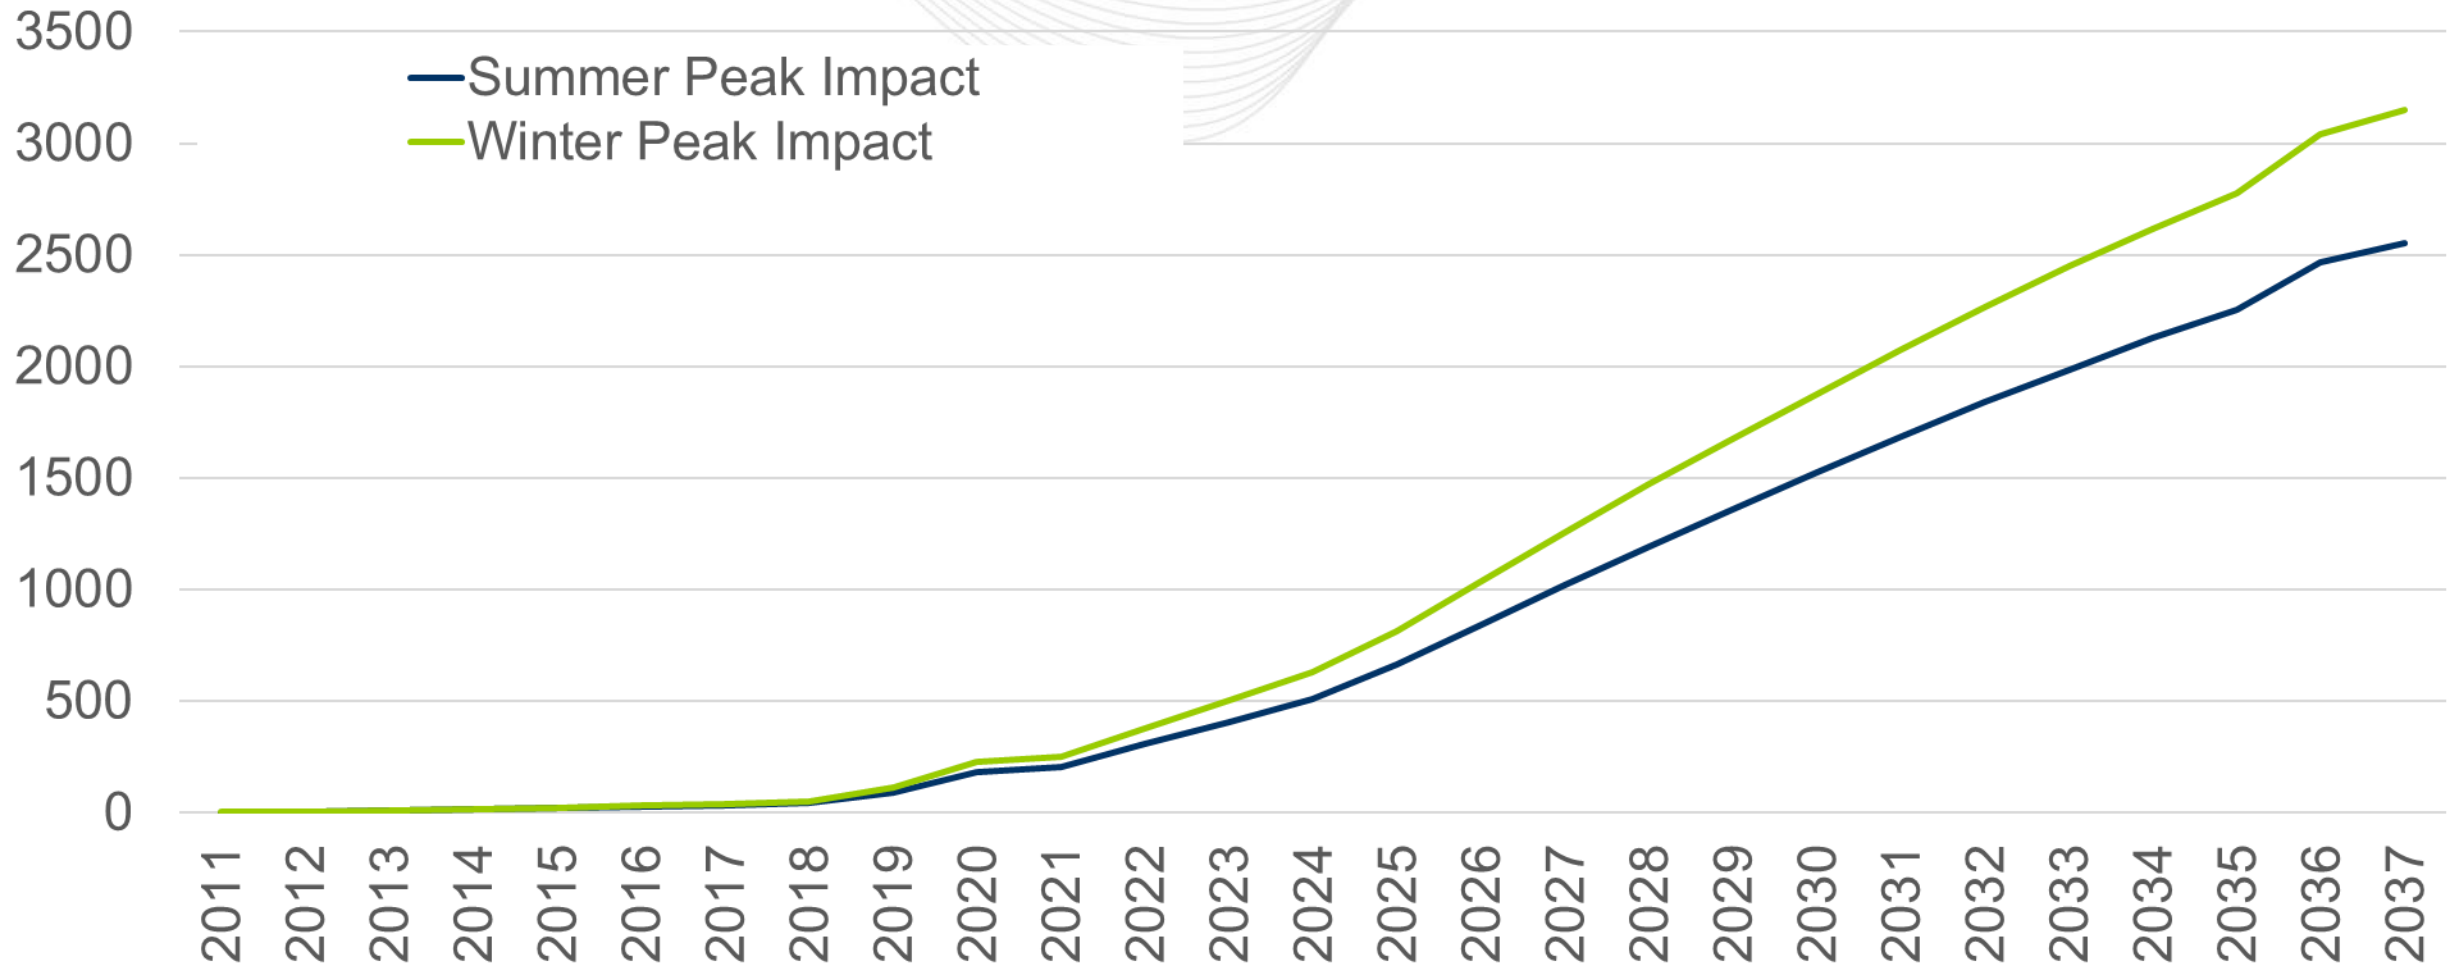

- Assumptions
 - Future charging shifts increasingly towards off-peak on weekdays.
 - Winter charging needs are greater than in Summer.
 - Key resource on charging:
 - ISO New England
 - https://www.iso-ne.com/static-assets/documents/2021/04/final_2021_transp_elec_forecast.pdf

PEV Peak Impact (MW)

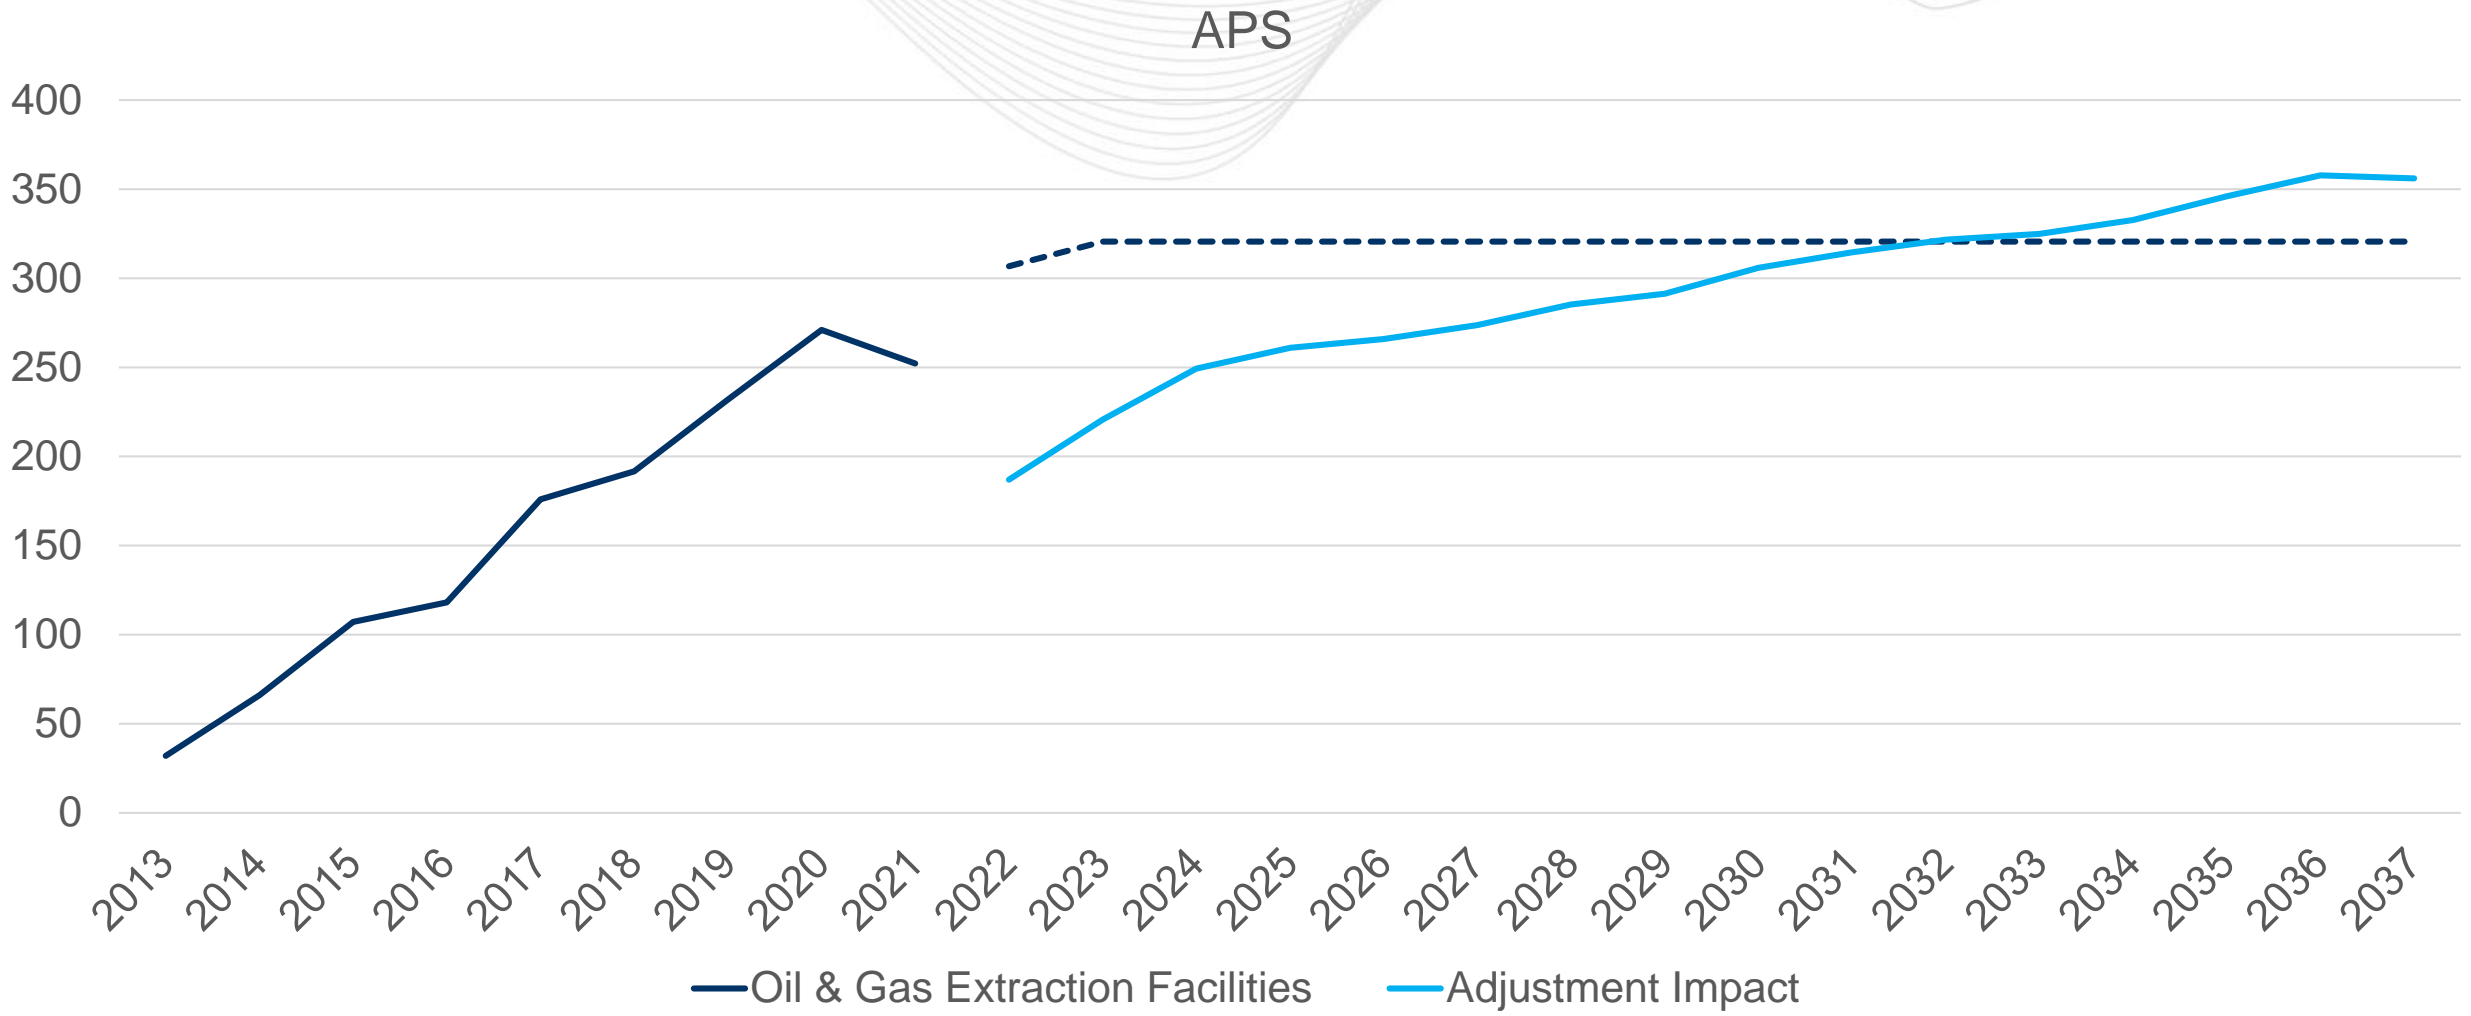

Peak Impact (MW)

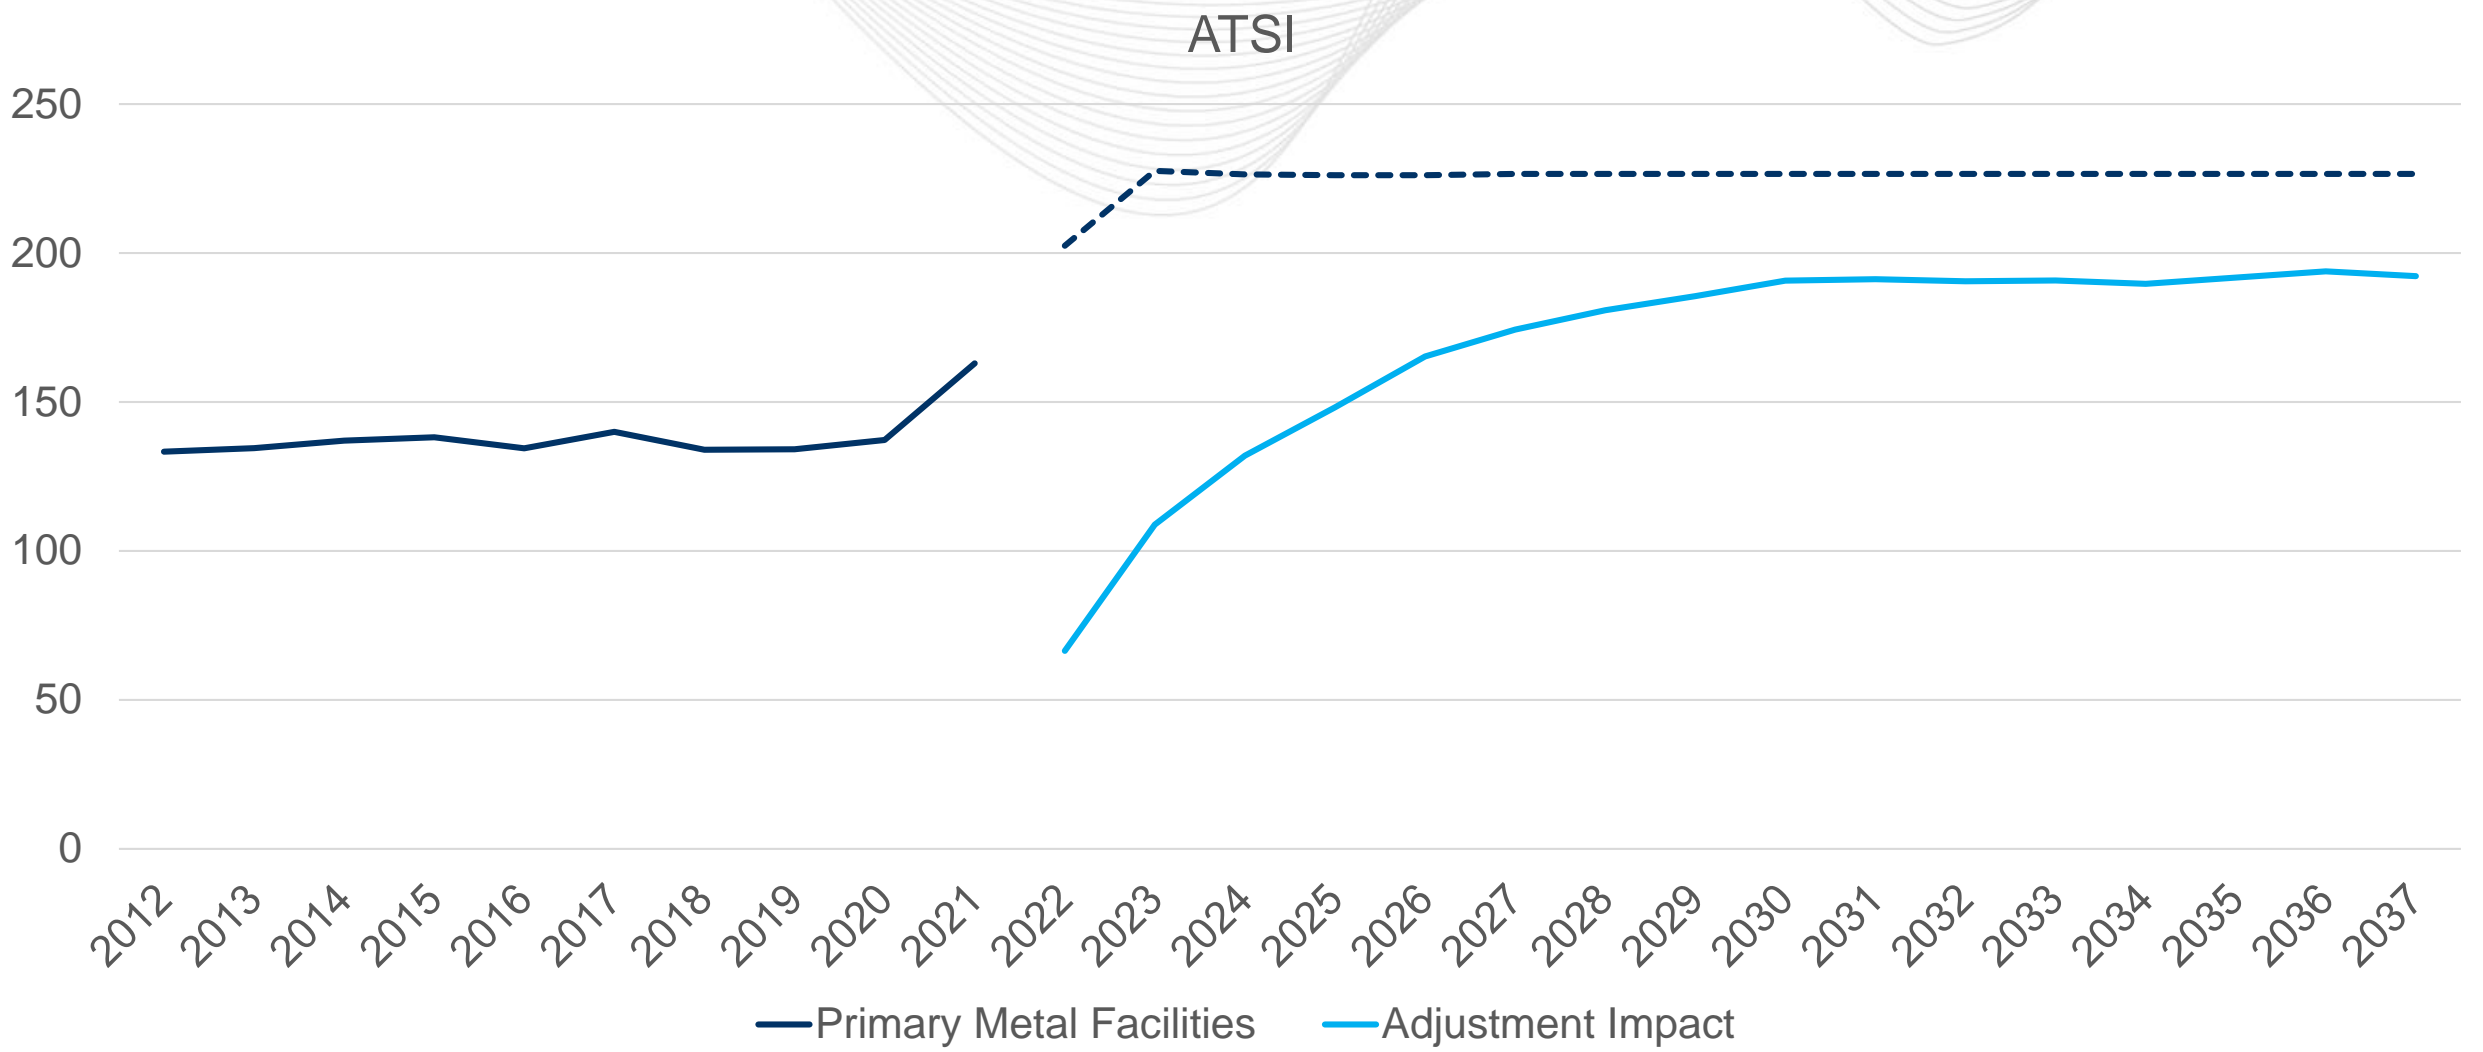

Forecast Adjustments

- EDCs are encouraged to provide PJM with information about large changes that may not be captured in the forecast process.
- PJM evaluates and incorporates using the sector models. We view requests through the lens of:
 - Is the request significant?
 - Is there risk of double counting?
 - Is the trend likely captured in the economic forecast?
 - Can the trend be removed from the history?

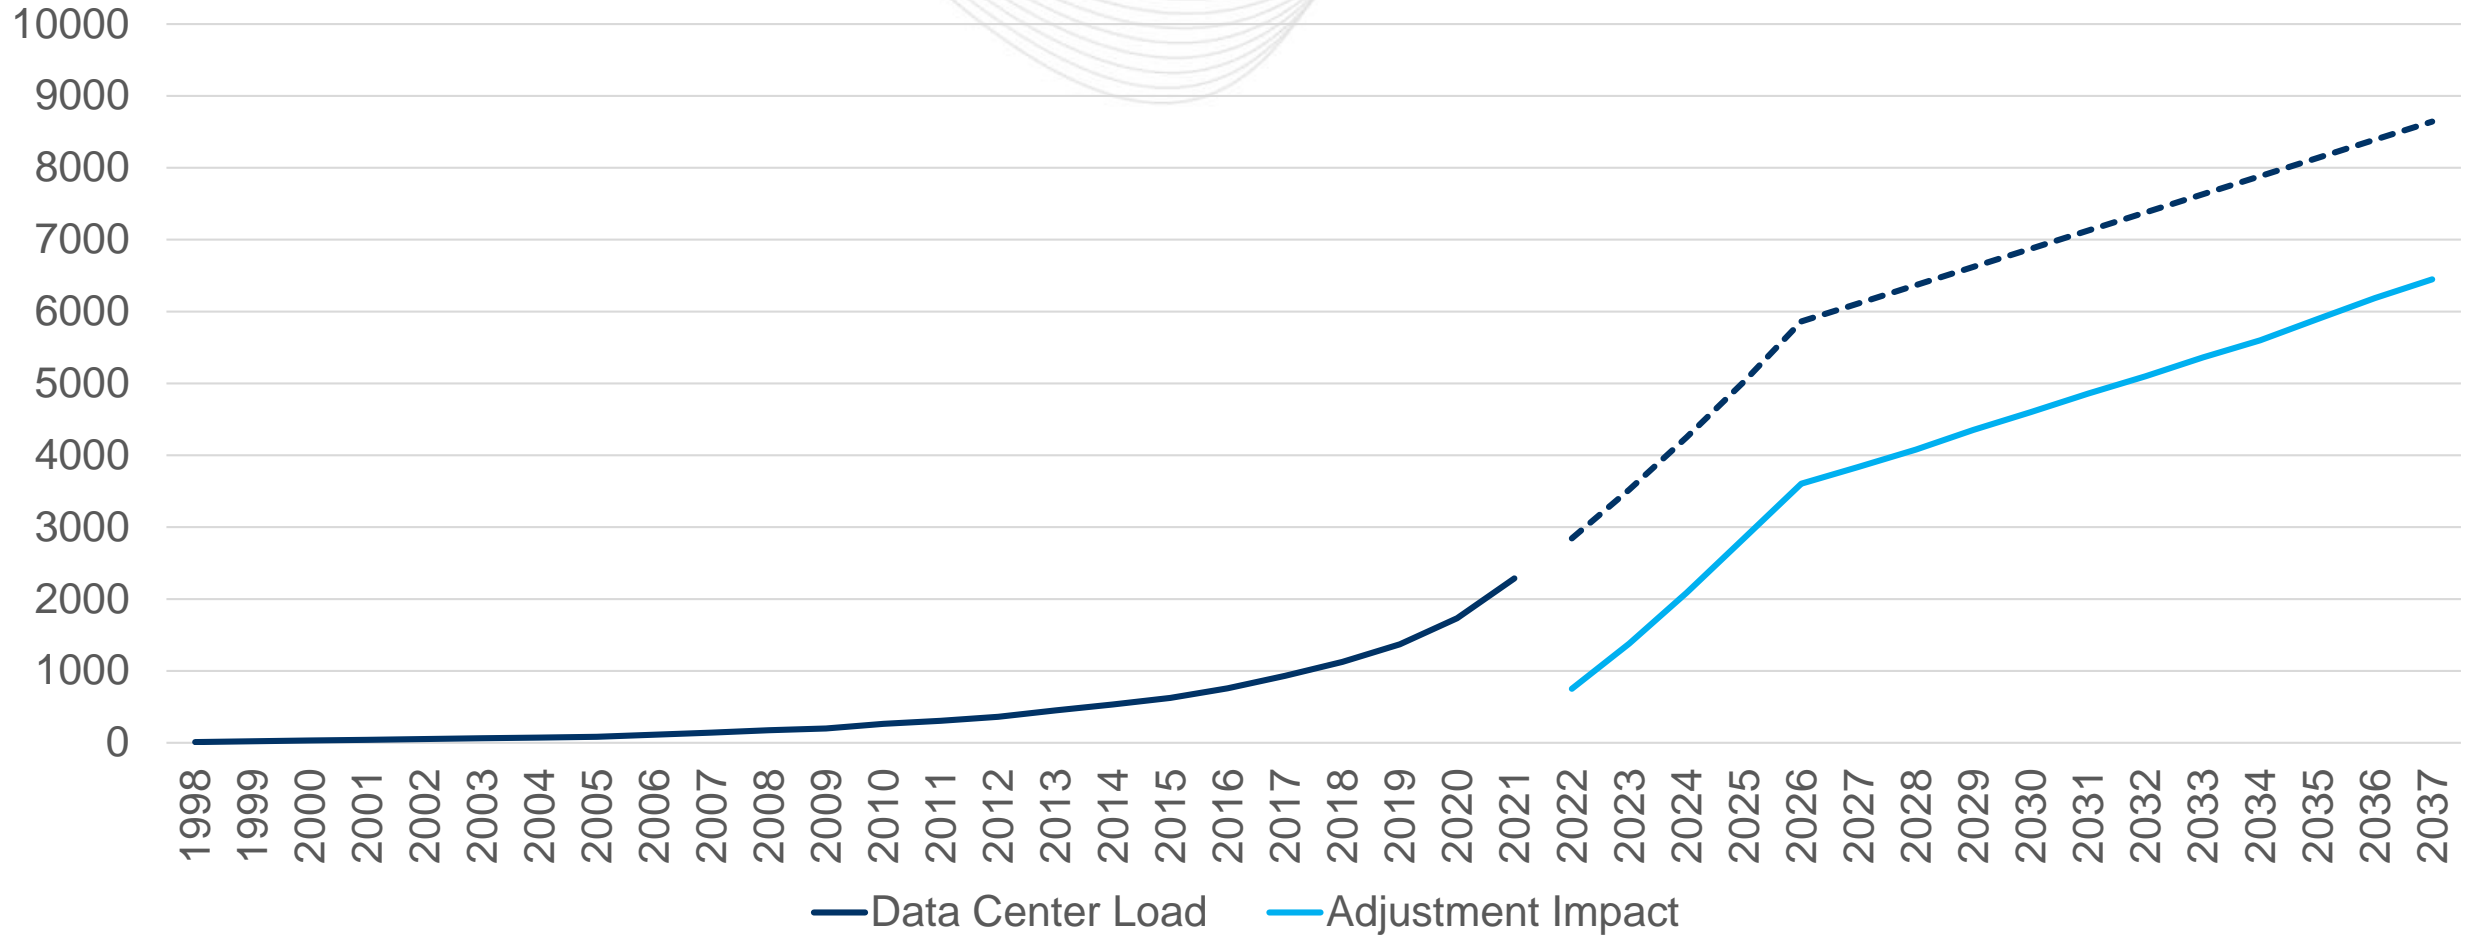

- Remove impact of adjustment on history
 - If decrementing load, increase load with historical effects
 - If increasing load, reduce load with historical effects
- Restore impact of adjustment to forecast
 - If decrementing load, reduce forecast with anticipated effects
 - If increasing load, add to forecast with anticipated effects
- “Adjustment Impact” is calculated by comparing with a forecast as if there were no explicit treatment.

Dominion

Preliminary Forecast

Summer Forecast Comparison 2021 vs 2022

- 15-year Annualized Growth Rate
 - 2021 LF: 0.2%
 - 2022 Prelim: 0.4%

- Select year comparisons (2022 Prelim vs 2021LF)
 - 2025: Down 0.5%
 - 2027: Down 0.1%
 - 2036: Up 1.5%

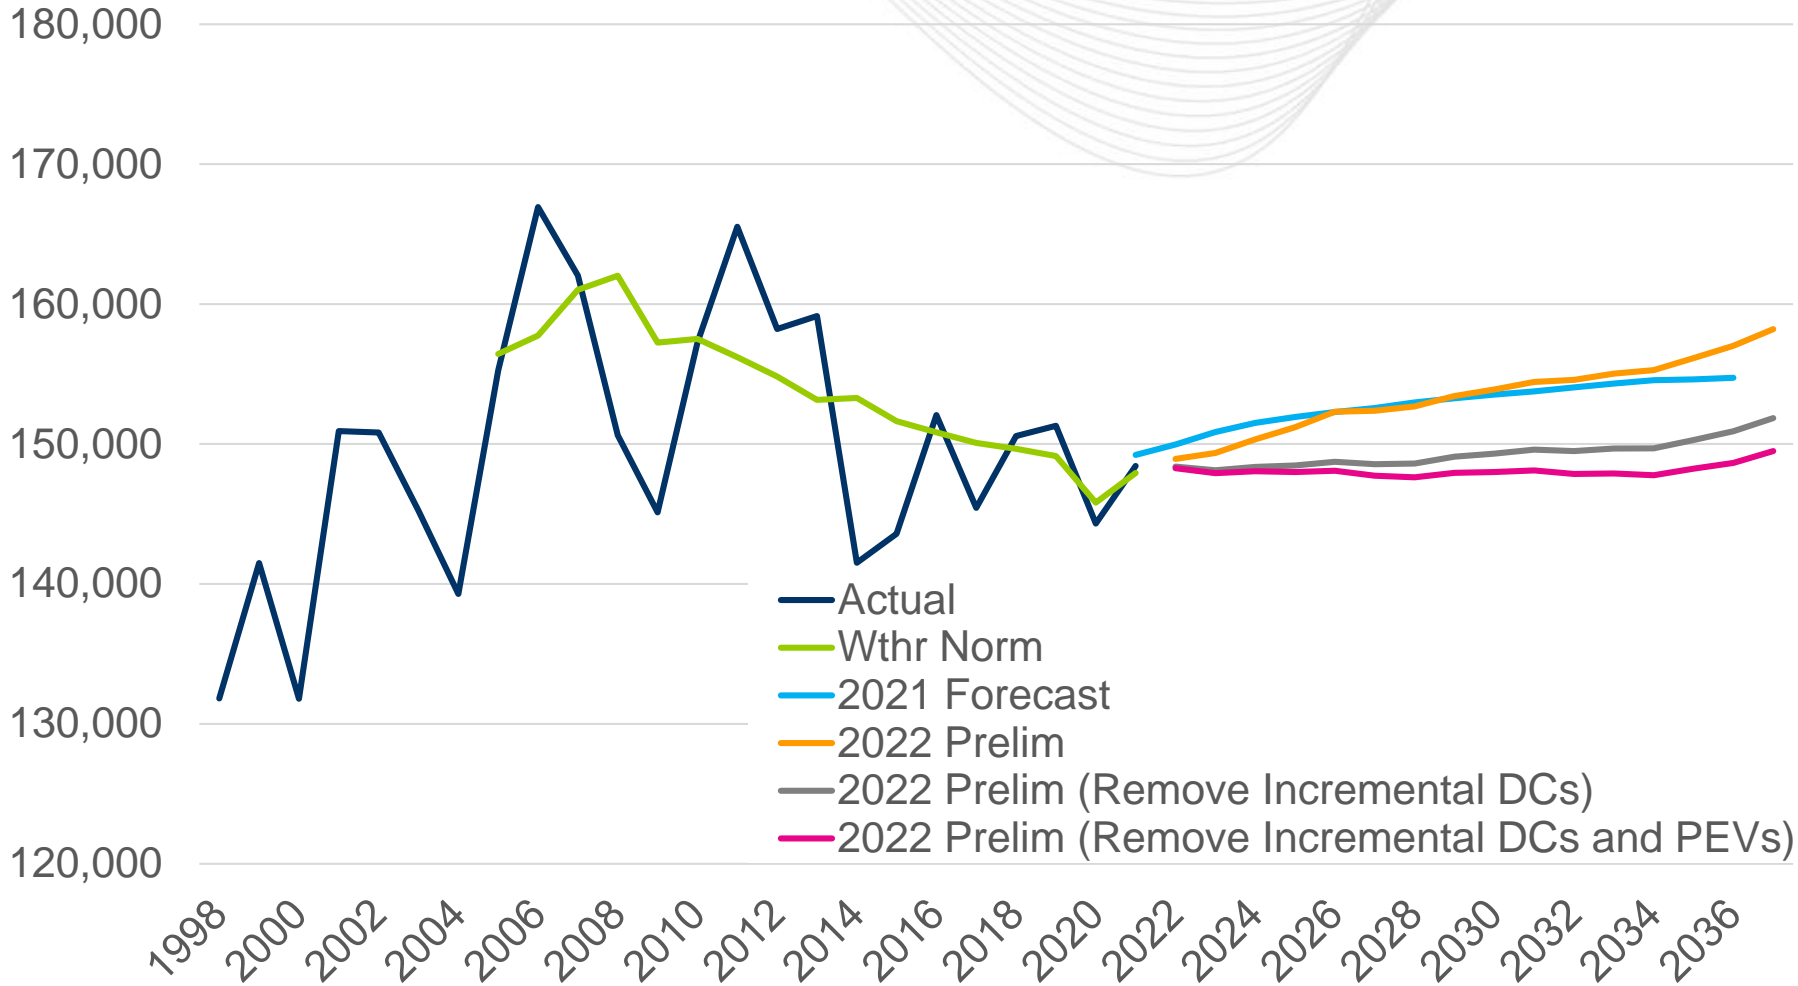

Recall chart from Nov 9 LAS - Summer Peak Forecast

- New model alone leads to lower growth.
- “Test Forecast” is a representation of what the forecast would have been had we been using the new model for the 2021 Forecast.
- The change is in some of the exogenous assumptions.

Impact of Incremental Data Centers and PEVs

- Without new data centers and new PEVs, 15-year average annual growth would be a scant 0.05%.
- Additional data centers add 0.25% per year to growth.
- Additional PEVs add 0.1% per year to growth.

Growth Drivers

- “Add Economic/Use Growth” includes no future efficiency gains or future solar
- PEV and Data Centers contribution shown here is only additions beyond 2021.

Growth Reducers

2024 Summer Peak Distribution Comparison

50/50 Forecast = 1.0

2022 Load Forecast used weather simulation of 1994-2020 to construct distribution compared with 1993-2019 in 2021 Load Forecast.

Summer Forecast with 90/10 and 10/90 Weather Bands

Summer Peak Average Annual Growth (2022-2037)

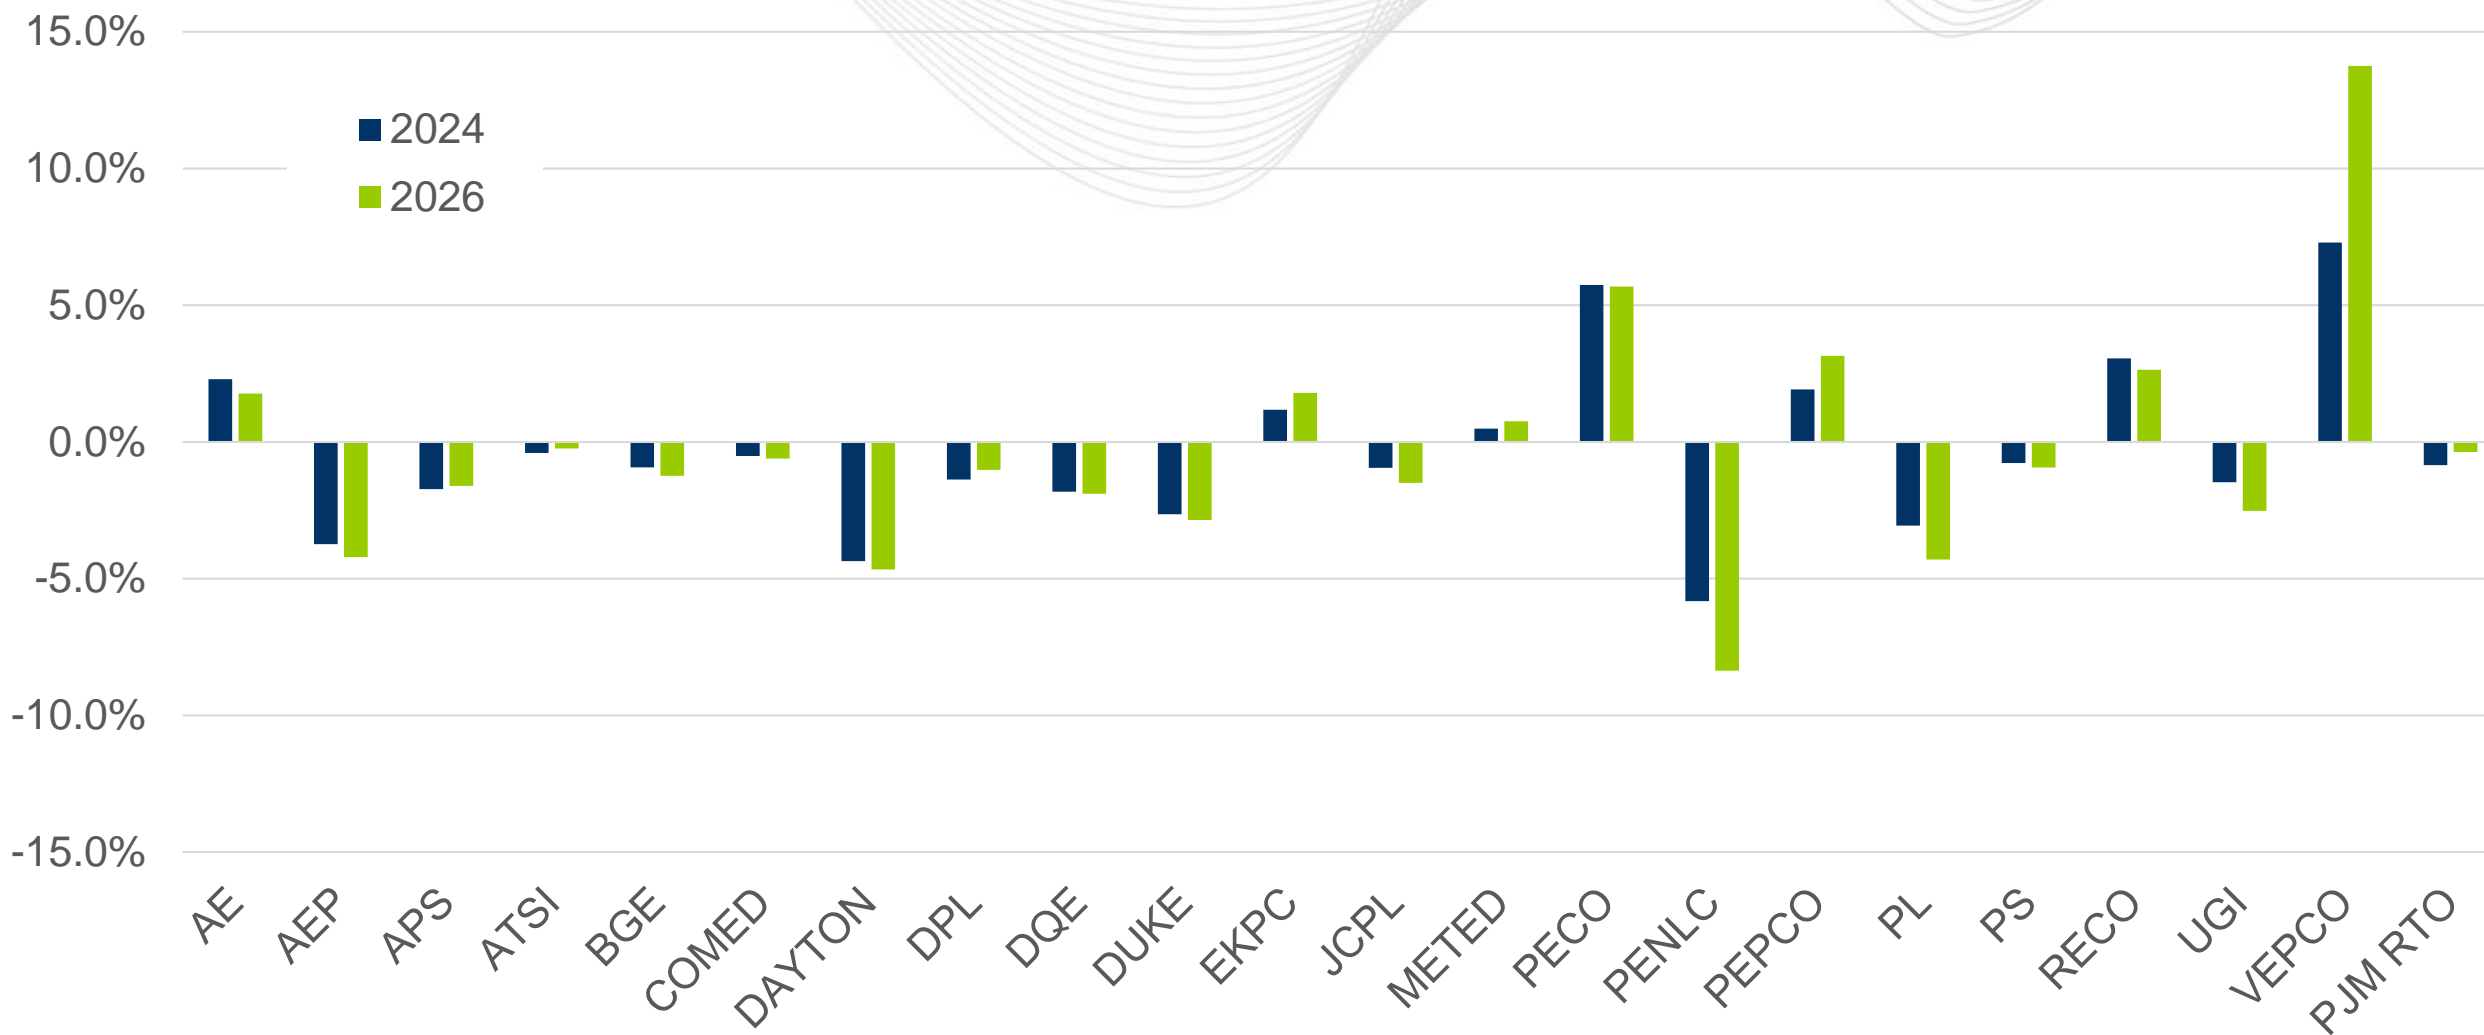

Percent Change in Summer 50/50 Forecast 2022 Preliminary vs 2021 Load Forecast

Percent Change in Summer 90/10 Forecast 2022 Preliminary vs 2021 Load Forecast

Winter Forecast Comparison 2021 vs 2022

- 15-year Annualized Growth Rate
 - 2021 LF: 0.2%
 - 2022 Prelim: 0.6%

- Select year comparisons (2022 Prelim vs 2021LF)
 - 2025: Up 2%
 - 2027: Up 2.7%
 - 2035: Up 6%

Growth Drivers

- “Add Economic/Use Growth” includes no future efficiency gains or future solar
- PEV and Data Centers contribution shown here is only additions beyond 2021.

Building to a Winter Peak Forecast – Part II

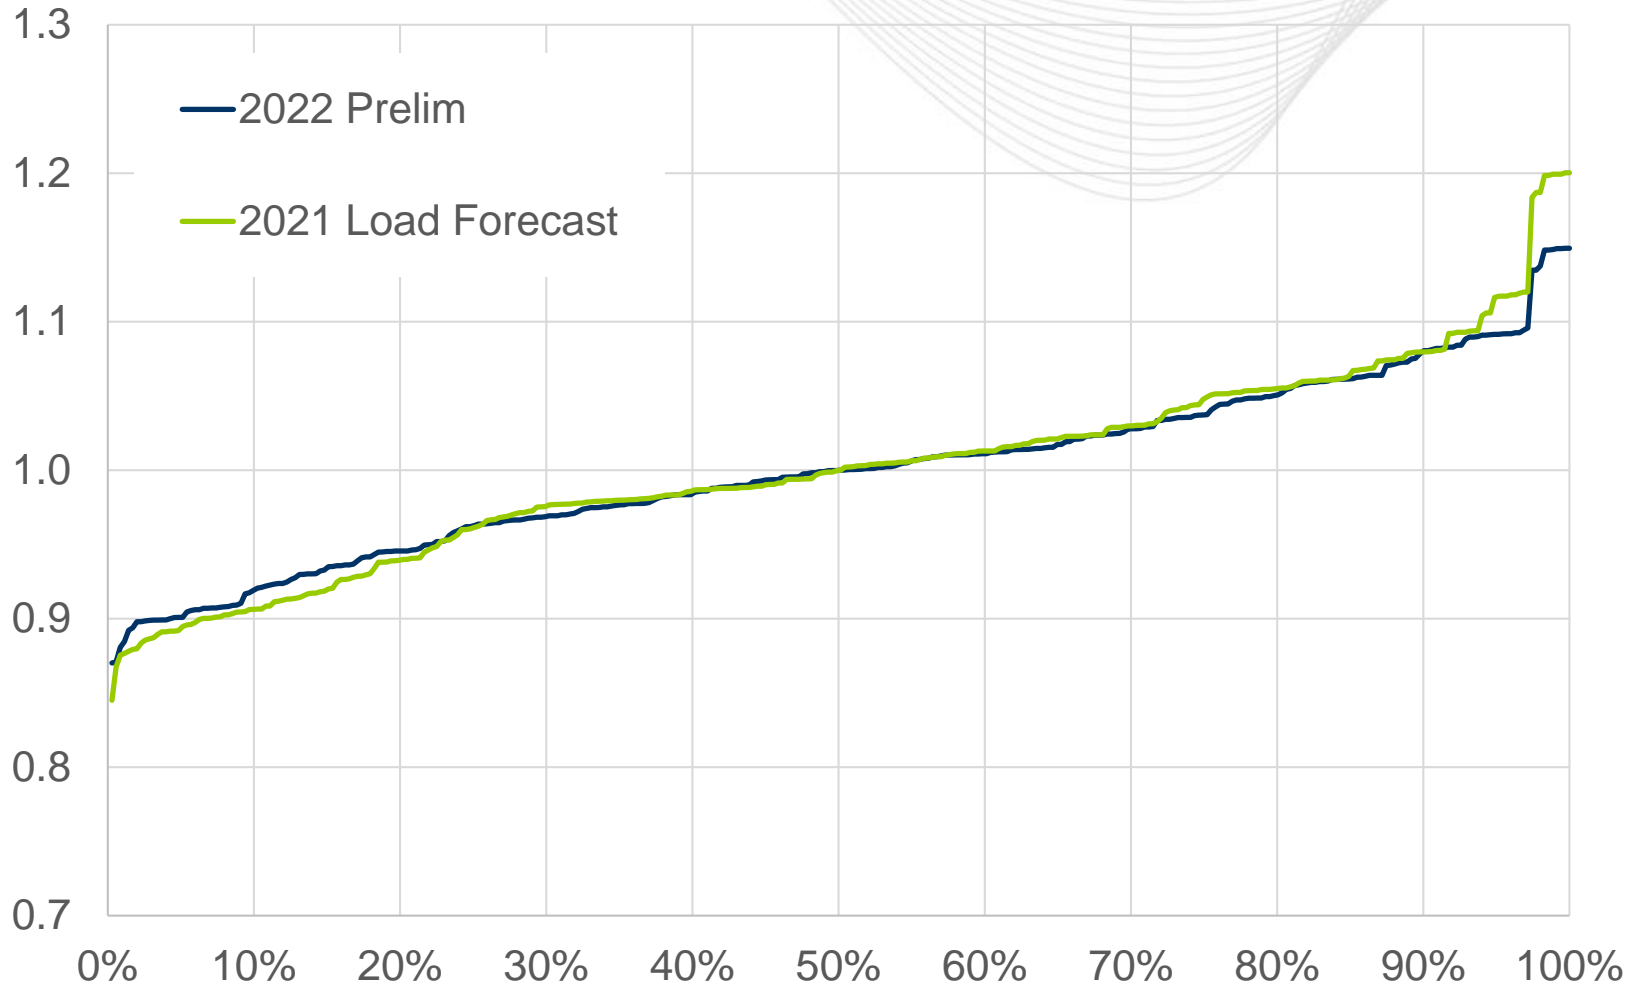

Growth Reducers

Winter Peak Distribution Comparison

50/50 Forecast = 1.0

2022 Load Forecast used weather simulation of 1994-2020 to construct distribution compared with 1993-2019 in 2021 Load Forecast.

Winter Forecast with 90/10 and 10/90 Weather Bands

Winter Average Annual Growth (2021DY – 2036DY)

Percent Change in Winter 50/50 Forecast 2022 Preliminary vs 2021 Load Forecast

Percent Change in Winter 90/10 Forecast 2022 Preliminary vs 2021 Load Forecast

- Transition to hourly framework
- Continue development on forecast assumptions
 - Electric Vehicles
 - Storage
- Review/implement consultant recommendations
 - Modeled forecast
 - EVs, Solar/Storage, Load Management

- Review with Planning Committee (12/14/2021)
- Publish final report in late December
 - Accompanying spreadsheets
 - Unrestricted Loads
 - Model Details Spreadsheets
 - End-Use Indices
 - Weather Variables
 - Statistical Appendix
 - Load Report Supplement
